- ASP.NET
- .NET Core
- .NET Framework
- WPF
- WinForms
- Android
- MVC
- Azure App Services
- Azure DevOps
- SQL Server
- Git
- phpMyAdmin
- Docker
- WordPress

## **PROJECTS (<https://janpauw.co.za>)**

### **CacheGo:**

Geocaching Android app, developed as part of a college project. The app allows users to hide & find caches in their local area. The app was developed using Android Studio and Java. We used Google Maps API to implement our maps and navigation features, while Firebase Realtime Database was used to store all information. Published to [Google Play](#).

### **Disaster Alleviation Foundation:**

Disasters and Donations management web app. Using this web app users can register and keep track of current disasters around the world. Users can also make monetary and goods donations, which can then be allocated to specific disasters. This web app was developed using Visual Studio and C# (ASP.NET Core 6.0). To store the app's data Entity Framework Core along with dependency injection was used to communicate with an SQL Database hosted on Azure.

### **CargoHub: (In Development)**

A web app developed for logistics businesses to help keep track of their cargo fleet, customers, and employees. Originally the web app was created with ASP.NET Framework, but as I learned more efficient and modern languages and solutions, I am actively updating the system to ASP.NET Core 6. This web app also uses Entity Framework Core along with dependency injection, but the SQL Database used to store all the data is self-hosted by me, using Docker.

### **UniManageApp:**

Web app developed for students to keep track of their modules and their study times. The app was created with ASP.NET Framework and uses ADO.NET to communicate with a self-hosted SQL server using docker.
